You are absolutely right. To truly master the HR round at Deloitte, we need to address every single aspect of their evaluation criteria. Let's break down all 11 specific headings from the session and map them directly to your three years of experience, your technical achievements, and your specific projects.
Here is your comprehensive, section-by-section preparation guide:

1. "Tell Me About Yourself"

This is a 60 to 90-second pitch testing your focus and your connection to Deloitte. You must use a Present, Past, and Why-here structure. Family history does not belong here.

- **Present:** Start with your current role. "I am a software engineer with three years of experience, currently building backend APIs for an e-commerce platform using Liferay."
- **Past:** Highlight your achievements with impact. "Previously, I developed a Python-based automation tool that reduced a two-hour manual server validation process down to five minutes across multiple concurrent servers. I also built Spring Boot and React applications for telecom site automation, and recently cleared the Wings1 program with distinction by delivering a secure Spring Boot CRUD project."
- **Why-here:** Form a clean bridge to Deloitte. "I enjoy debugging root causes and optimizing workflows, and the variety of problem-solving is exactly why I am drawn to consulting at Deloitte."

2. "Why Deloitte? Why Consulting?"

Interviewers reject generic answers like "Deloitte is a great company". They are testing if you want *this* firm and *this* work.

- **Layer 1 (Consulting):** Focus on the fast learning curve and client exposure. Emphasize that you learn faster across many projects rather than going deep on just one.
- **Layer 2 (Deloitte):** Mention the intersection of business problems and modern engineering. You want to help large organizations ship changes, not just advise on them.

3. The Project Deep-Dive

You will be heavily grilled on your resume claims, roles, and day-to-day work.

- **Actionable Advice:** Focus on your "Digital Gate (Hoto Automation)" project. Separate "We" from "I" by clearly stating your ownership of the Python backend. Be prepared to defend your architecture summaries. Explain exactly *how* you handled logging into diverse servers (Nokia, Samsung, Ericsson), parsing the .txt outputs, and handling server limitations where commands couldn't be run all at once. Highlight the business impact: transforming a sequential 2-hour human task into a concurrent 5-minute automated task.

4. Conflict With a Teammate

This tests your maturity and ability to stay professional when tensions rise.

- **Actionable Advice:** Frame this around a technical disagreement. For instance, think of a time during the Site Automation project where you disagreed with a frontend React developer on how an API should be structured, or during Digital Gate on how to handle

server timeouts. Show how you listened, focused on shared goals, and achieved dual outcomes where both the relationship and the work improved.

5. Leadership Under a Deadline

Deloitte values leadership at every level, equating leadership with ownership rather than a manager title.

- **Actionable Advice:** Use your "Star of the Month" award or a specific debugging scenario. Tell a time you saw a problem, stepped in, and took action to help a stuck teammate or resolve an incident. Emphasize the collaborative impact and the team-level benefit in the result.

6. Competing Priorities & Pressure

Consultants often run more than one workstream. You must show how you prioritize structure, not panic.

- **Actionable Advice:** Avoid lazy answers like "I just worked harder". Show the trade-offs you made by ranking tasks by impact and deadline. For example, explain how you balanced building new partner APIs in your current Liferay project while debugging a critical root-cause issue on an older Spring Boot deployment, and how you communicated those decisions to stakeholders.

7. Failure & Technical Bugs

This tests self-awareness and growth.

- **Actionable Advice:** Pick a genuine technical mistake that you owned and fixed. Perhaps an early assumption in your Python script caused it to fail on a slower 5G server response. Structure the answer by explaining what went wrong, how you recovered, and the concrete habit that changed afterward (e.g., implementing dynamic wait times or better exception handling).

8. Ethics & Disagreeing With a Manager

Deloitte places heavy weight on ethics and integrity under conflicting interests.

- **Actionable Advice:** Provide a scenario of respectful disagreement. If a manager ever asked you to skip a validation step to hit a deadline, explain how you showed reasoning, weighed the consequences, and proposed a middle path that protected both the deadline and the system's integrity. Focus on evidence-based discussions.

9. Adapting to Change

Consultants are constantly dropped into unfamiliar codebases.

- **Actionable Advice:** Prove you do not panic by highlighting your tech stack transitions. Show your method for learning: you moved from Spring Boot/React in your first project to Python automation, and now to Liferay for e-commerce. Explain how you use documentation, pair with teammates, and ship small experiments early to build confidence despite the unfamiliarity.

10. HR Logistics

These are practical screening questions.

- **Actionable Advice:** State your notice period accurately, as it surfaces in background checks. Have a considered answer for relocation. Be ready for evening or night shift overlap for US/UK clients. When asked why you are leaving, frame it forward (growth, exposure) and never criticize your current employer.

11. Salary Negotiation

This tests self-awareness about market value.

- **Actionable Advice:** Do your research on realistic bands. Never undersell early by disclosing your current salary as your only anchor. Anchor on value—talk about your skills, the impact of your automation reducing 2 hours to 5 minutes, and your distinction in Wings1. Deflect gently initially, and remember to negotiate the full package (fixed, variable, joining bonus).

Closing: The Last Impression Always prepare 2-3 questions to ask them at the end, separating 'I' from 'we', and saving money discussions for last.

To make sure your responses sound completely natural, which of the behavioral areas—such as a specific "Failure & Technical Bug" or "Adapting to Change"—would you like to practice drafting an exact STAR-format answer for first?
